Topic : CLOUD COMPUTING

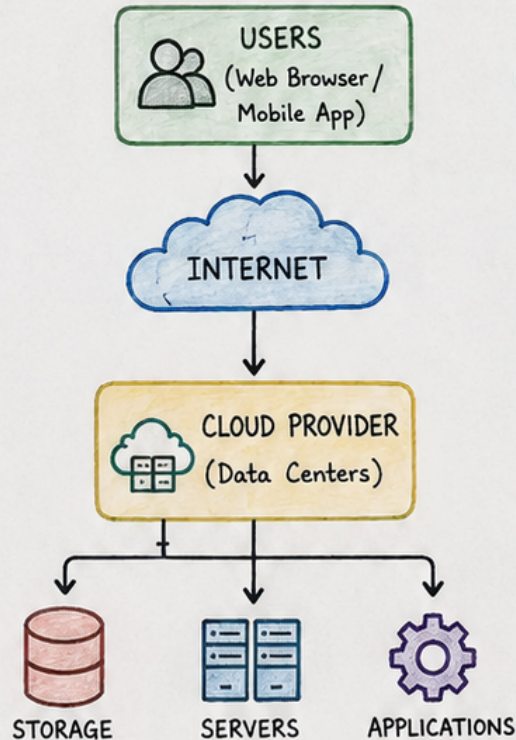

1. CLOUD BASICS

Cloud Computing is the delivery of computing services like servers, storage, databases, networking, software and analytics over the internet ("the cloud") to offer faster innovation, flexible resources and savings.

2. HOW CLOUD WORKS

3. SERVICE MODELS

• IaaS

Infrastructure as a Service. Provides virtualized computing resources over the internet. (e.g., AWS EC2, Azure VMs)

• PaaS

Platform as a Service. Provides a platform for developers to build, test and deploy applications. (e.g., Google App Engine, Microsoft Azure App Service)

• SaaS

Software as a Service. Delivers software applications over the internet on a subscription basis. (e.g., Google Workspace, Microsoft 365)

4. DEPLOYMENT MODELS

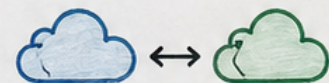

PUBLIC CLOUD

Services are provided over the public internet and shared among multiple organizations. Cost-effective and scalable. (e.g., AWS, Google Cloud)

PRIVATE CLOUD

Services are used exclusively by one organization. More control, security and customization. (e.g., On-premise cloud, VMware Cloud)

HYBRID CLOUD

Combination of public and private clouds. Allows data and applications to be shared between them. Offers flexibility and balance.

5. REAL-WORLD USE CASE

Netflix uses cloud computing (AWS) to stream movies and shows to millions of users worldwide. The cloud helps them handle huge traffic, store massive amounts of data and deliver a smooth streaming experience anytime, anywhere.

CLOUD COMPUTING – SCALABLE RESOURCES, ANYTIME, ANYWHERE!
